**Testicular Cancer**

**Definition:** Testicular cancer usually develops in one or both testicles in young men. This cancer is highly treatable and usually curable.¹

**Background:** From 2002 to 2006, there was a yearly average of approximately 303 newly diagnosed cases of testicular cancer in Ohio.² During this same time period, Ohio experienced approximately 14 deaths each year due to testicular cancer.²

Testicular cancer is not very common and treatment is very successful, making the risk of dying from this cancer very low.¹

The American Cancer Society recommends seeing a physician immediately if a lump is discovered in the testicles.¹ It may be beneficial to perform monthly self-examinations, as well as having a physician examination during routine cancer-related checkups.¹

Risk Factors

**Males:** In the United States, 1 in 270 males will **develop** testicular cancer and 1 in 5,000 males will **die** from testicular cancer.3

Several risk factors may contribute to the development of testicular cancer. They include:1

- Undescended testicle
- Family history of testicular cancer
- HIV infection
- Carcinoma in situ in the testicles
- Cancer of the other testicle
- Age- Nine out of ten cases of testicular cancers occur in men aged 20 to 54.
- Race and ethnicity- White men have a risk that is five times higher than African American men and three times higher than Asian-American and American Indian men.
- Body size- There may be an increased risk of testicular cancer in tall men.

Symptoms1

- Lump in testicle (may or may not be painful)
- Swollen testicle
- Feeling of heaviness or aching in lower abdomen or scrotum
- Sore breasts (in rare cases)
- Loss of sexual desire
- Lower back pain
- Trouble breathing, chest pain, cough
- Abdominal pain
- Headaches
Screening, Prevention and Early Detection

**Screening:**

Many testicular cancers can be detected at an early stage. A lump in the testicle is usually the first sign; however some early testicular cancers cause symptoms that need medical attention. Still, other testicular cancers may not cause any symptoms until they have reached an advanced stage.

The American Cancer Society recommends a testicular examination by a physician as part of a general physical exam and routine cancer-related checkup. Some physicians recommend monthly self-examinations. The American Cancer Society also advises that men see a physician immediately if a lump is found.

**Prevention:**

Testicular cancer may not be preventable at this time because the exact cause of this cancer is unknown. The risk factors of age, race, undescended testicle, and family history cannot be controlled.

**Staging**

Stage at Diagnosis describes the severity of a person’s cancer and the extent to which it has or has not spread throughout the body.\(^4\) Cancer staging is important in helping physicians plan appropriate treatment, as well as to estimate a patient’s prognosis.\(^4\) Cancer diagnosed in the *in situ* and localized stages are generally referred to as early-stage tumors, whereas regional and distant tumors are referred to as late-stage tumors.\(^2\) Detecting cancers at an early stage may increase long-term survival and can lead to a reduction in mortality.\(^2\)

The National Cancer Institute groups staging into five main categories:\(^4\)

- **In situ:** Abnormal cells are present only in the layer of cells in which they developed. In this report, *in situ* cases are only included for bladder cancer.
- **Localized:** Cancer is limited to the organ in which it began, without evidence of spread.
- **Regional:** Cancer has spread beyond the primary site to nearby lymph nodes or organs and tissues.
- **Distant:** Cancer has spread from the primary site to distant organs or distant lymph nodes.
- **Unstaged/Unknown:** There is not enough information to determine the stage.
Chart 23b

Stage at Diagnosis for Invasive Testicular Cancer Diagnosed in Cuyahoga County from 2002-2006

- Localized: 58%
- Regional: 27%
- Distant: 11%
- Unstaged: 4%

Table 23d

5-year Relative Survival* by Stage at Diagnosis for Testicular Cancer in the United States for 1999-2006, All Races, Both Sexes

<table>
<thead>
<tr>
<th>Stage at Diagnosis</th>
<th>5-year Relative Survival (%)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Localized (confined to primary site)</td>
<td>99.2</td>
</tr>
<tr>
<td>Regional (spread to regional lymph nodes)</td>
<td>96.0</td>
</tr>
<tr>
<td>Distant (cancer has metastasized)</td>
<td>71.5</td>
</tr>
<tr>
<td>Unknown/Unstaged</td>
<td>87.2</td>
</tr>
</tbody>
</table>

*Relative survival compares observed survival for those with cancer to the expected survival for those without cancer.
Figure 23b

Average Annual Percentage of Testicular Cancers Diagnosed in the Early Stages (In Situ or Localized) for Cuyahoga County during 2002-2006

Legend (See Footnote)
- Highest (69.3 - 100.0)
- Next Highest (66.8 - 69.2)
- Intermediate (66.1 - 66.7)
- Next Lowest (57.2 - 66.2)
- Lowest (<5.1)
