#### **Issue Brief**

### **COVID-19 Vaccine Comparison**

Last Updated: June 2, 2022

Three COVID-19 vaccines, <u>Pfizer-BioNTech</u>, <u>Moderna</u>, and <u>Johnson & Johnson (J&J</u>) are available in the United States. A listing of key details for each vaccine can be found below, which has evolved over time. This list is not exhaustive.

#### Vaccine Administration for Primary Series and Additional Doses

Pfizer-Biol Vaccine	NTech/COMIRNATY	Moderna Vaccine	a/SPIKEVAX	Janssen (J&	J) Vaccine
Primary Series		Primary Series		Primary Series	
<u>5-11 years</u> old	Emergency Use Authorization (EUA). Administered by intramuscular (IM) injection using 0.2 mL (10 $\mu$ g), mixed with a 0.9% sodium chloride diluent, with a maximum of 10 doses per vial, using a vial with an <u>orange cap</u> . Two <u>shots</u> are required, separated by three weeks (21 days).	this age gro		age group.	authorized for this
<u>12-15</u> years old	EUA. Administered by IM injection using: Purple cap vial: A 0.3 mL dose (30 μg), mixed with a 0.9% sodium chloride diluent, with a maximum of six doses per vial, OR Gray cap vial: A 0.3 mL dose (30 μg) with a maximum of six doses per vial (Do not dilute this formulation). Two shots are required, separated by three to eight weeks (21 days).	No Modern this age gro	a vaccine authorized for up.	No J&J vaccine a age group.	authorized for this
<u>16 years</u> and older	Fully licensed (Biologics License Application) <b>under</b> <b>the name Comirnaty.</b> Administered by IM injection using either: <u>Purple cap vial</u> : A 0.3 mL dose (30 μg), mixed with a 0.9% sodium chloride diluent, with	<u>18 years</u> and older	Fully licensed (Biologics License Application) under the name SPIKEVAX. <u>Administered</u> by IM injection using a 0.5 mL (100 µg) dose, not mixed with a diluent, with a maximum of 15 doses	<u>18 years</u> and older	EUA. <u>Administered</u> by IM injection using a 0.5 mL dose with a maximum of five doses per vial, using a vial with

a maximum of six doses per vial, OR <u>Gray cap vial</u> : A 0.3 mL dose (30 µg) with a maximum of six doses per vial (Do not dilute this formulation). <u>Two shots</u> are required, separated by three to eight weeks.	per vial, using a vial with a <u>red cap</u> (Moderna/SPIKEVAX). <u>Two shots</u> are required, separated by four to eight weeks.		a <u>blue cap</u> . <u>One</u> <u>shot</u> is required.			
Additional Dose for People with Modera	Additional Dose for People with Moderate to Severe Immunocompromise					
People ages five years and older should get an <u>additional (third) primary shot</u> of Pfizer- BioNTech COVID-19 vaccine given 28 days after the second dose using the <u>vial and cap</u> <u>colors</u> referenced above, for the appropriate age group.	People ages 18 years and older should receive an <u>additional primary</u> <u>dose</u> (third dose) of Moderna vaccine (0.5 mL) at least 28 days after the second dose using a vial with a <u>red</u> <u>cap</u> (Moderna/SPIKEVAX).	primary dose of least 28 days lat COVID-19 vaccir second dose, ad (100 µg) dose us	J for their first eive an <u>additional</u> mRNA vaccine* at er. If Moderna he is used for the minister a 0.5 ml sing a vial with a <u>hical Guidance for</u>			

#### Vaccine Administration of Booster, Second Booster, and Heterologous Booster Doses

Adults 50 years and older who first received J&J, regardless of what type of booster they received, should receive a second booster dose using an mRNA COVID-19 vaccine at least four months after the first booster dose. See <u>Clinical Guidance for COVID-</u>
19 vaccine at least four months after the first booster dose. People ages 12 years** and older who are moderately or severely immunocompromised should receive a <u>second booster dose</u> using an mRNA COVID-19 vaccine at least four	<ul> <li>an mRNA COVID-19 vaccine at least four months after the first booster dose.</li> <li>People ages 18 years and older who are moderately or severely immunocompromised should receive a second booster dose of mRNA vaccine, at least four months after</li> </ul>	both their primary series dose and booster dose, may receive a second booster dose of an mRNA COVID-19 vaccine at least four months after the first J&J booster dose. Adults 50 years and older who first received J&J, regardless of what type of booster they received, should receive a second booster dose using an mRNA COVID-19 vaccine at least four months after the first booster dose.

\* Although mRNA vaccines are preferred, J&J/Janssen COVID-19 vaccine may be considered in some situations.

\*\* For 12–17-year-olds, only the Pfizer-BioNTech COVID-19 vaccine is authorized and recommended for use. <sup>+</sup> CDC recommendations allow a person to choose which vaccine booster product they receive (mix and match). Pfizer-BioNTech or Moderna (mRNA COVID-19 vaccines) are preferred in most situations.

#### **Side Effects**

The benefits of vaccine outweigh the risks. However, side effects have been reported. <u>Serious health events</u> <u>after COVID-19 vaccination are rare</u>. Common side effects include pain, redness and swelling at the injection site, tiredness, headache, muscle pain, chills, nausea, joint pain, and fever. Less common severe side effects include severe allergic reactions. See additional information on vaccine side effects for <u>Pfizer-BioNTech</u>, <u>Moderna</u>, and J&J.

Since April 2021, FDA has investigated rare but severe side effects associated with the COVID-19 vaccines. The mRNA vaccines (Pfizer-BioNTech and Moderna) were found to have a suggested <u>increased</u> risk of myocarditis and pericarditis. The J&J vaccine was found to have a suggested increased risk of <u>thrombosis with</u> <u>thrombocytopenia syndrome</u> and <u>Guillain-Barré Syndrome</u>. All events were found to be uncommon, and the vaccines' benefits continue to outweigh the risks found.

#### **Coadministration of Vaccine**

Following an emergency Advisory Committee for Immunization Practices (ACIP) meeting on May 12, 2021, CDC revised vaccine administration guidance indicating that COVID-19 vaccines can be co-administered with other vaccines without regard to timing. Coadministration information is summarized in <u>CDC's Interim Clinical</u> <u>Considerations guidance</u>.

#### Variants

**Update:** The <u>Omicron variant</u> was first detected in the United States in December 2021 and quickly became the dominant variant. Like other variants, Omicron is comprised of a number of lineages and sublineages. Current COVID-19 vaccines to protect against severe illness, hospitalizations, and deaths from infection with the Omicron variant. However, breakthrough infections in people who are fully vaccinated can occur. People who are <u>up to date</u> with their COVID-19 vaccines and get COVID-19 are less likely to develop serious illness than those who are unvaccinated and get COVID-19. CDC and WHO continue to monitor other <u>variants of interest</u>, <u>concern</u>, and high consequence. Track COVID-19 variant proportions <u>here</u>.

#### CDC and ACIP Recommend mRNA Vaccines to Combat COVID-19

On Dec. 16, CDC <u>endorsed</u> ACIP's updated COVID-19 vaccine recommendations. ACIP unanimously voted to say mRNA vaccines are preferred over the use of the Johnson & Johnson vaccine for all persons 18 years and older in the United States.

## Considerations for an Eight-Week Interval Between the First and Second Doses of a Primary mRNA Vaccine

Following a thorough evaluation of the latest <u>safety and effectiveness data</u>, CDC is providing <u>new information</u> to help healthcare providers recommend the optimal COVID-19 vaccination schedule based on the individual patient. This updated guidance is specific to the mRNA (Pfizer-BioNTech or Moderna) COVID-19 vaccine primary series and is only for some patients who are not yet vaccinated. Specifically, people ages 12-64 years old who are not moderately or severely immunocompromised—and particularly males ages 12-39 years—may benefit from getting their second mRNA COVID-19 vaccine dose eight weeks after their first dose, instead of after the FDA-approved or FDA-authorized three-week (Pfizer-BioNTech) or four-week (Moderna) interval.

Extending the time interval between primary mRNA COVID-19 vaccine doses from the FDA-approved or authorized three weeks (Pfizer-BioNTech) or four weeks (Moderna) to eight weeks may help increase how long protection lasts against COVID-19. It may also help lower the (small) risk of myocarditis (inflammation of the

heart muscle) and pericarditis (swelling of tissue around the heart), which has been associated—mostly among adolescent and young adult males—with mRNA COVID-19 vaccination.

#### **Population Specific Considerations**

#### **Pregnant and Lactating People**

The <u>American College of Obstetricians and Gynecologists</u>, the <u>Society for Maternal-Fetal Medicine</u>, and <u>CDC</u> recommend that all pregnant and lactating people should be vaccinated against COVID-19 in response to <u>growing evidence</u> of safe and effective use of COVID-19 vaccines during pregnancy and breastfeeding. <u>Safety</u> <u>monitoring systems</u> from FDA and CDC have not identified any safety concerns among pregnant or lactating people. Additionally, completed data from animal studies show no issues. Pregnant and lactating people should discuss the risks and benefits with their provider.

#### Children

On Nov. 2, the Pfizer-BioNTech COVID-19 vaccine was <u>authorized</u> for children 5-11 years of age. On Jan. 3, FDA <u>expanded</u> eligibility for the Pfizer-BioNTech COVID-19 vaccine to include the use of a single booster dose in individuals 12 years and older at least five months after primary vaccination with the Pfizer-BioNTech COVID-19 vaccine, and to allow for a third primary series dose of Pfizer-BioNTech COVID-19 vaccine for certain immunocompromised children ages 5-11 years. More information can be found on <u>CDC's website</u>.
